DISTRIBUTION OF APIACEAE SPECIES IN MONGOLIA

РАСПРОСТРАНЕНИЕ ВИДОВ СЕМЕЙСТВА ЗОНТИЧНЫЕ (APIACEAE) В МОНГОЛИИ

В сообщении приведены новые данные о видовом составе и распространении видов семейства Apiaceae в Монголии. На данный момент семейство представлено в Монголии 76 видами из 39 родов.

Introduction. The Celery family (Apiaceae Lindl.) is one of the biggest families in the Mongolian flora for which Gubanov (1996) reported 34 genera and 66 species. Subsequent studies enabled to update this information and currently the numbers grew up to 39 genera and 76 species. Below, a list of all Mongolian Apiaceae species is presented; distribution (fig. 1) is given according to 16 phyto-geographical regions proposed by V.I. Grubov (1982).

Materials and methods. Collections of Apiaceae from the Herbarium of the Institute of Botany, MAS (UBA), Herbarium of the National University of Mongolia (UBU), Herbarium of the Institute of Botany, CAS

+ – newly added species and new distribution region since Gubanov's (1996) conspectus; # – new combination since Gubanov's (1996) conspectus.

(PE), Herbarium Institute of Botany, RAS (LE), and Tracy's Herbarium of Texas University, USA, as well as own data, were used for the present study. A total of over 2800 specimens collected by a number of scientists between 1867–2011, have been studied.

Results. Taking into account recent taxonomical treatments, names of some taxa are changed compared to Gubanov (1996), e. g., the genera Kadenia and Kitagawia are not accepted, and three more species are treated under other generic names. Besides, 11 species from 7 genera were added to the flora of Mongolia while occurrence of Ferula gracilis in was not confirmed. With all these changes, at the present time Apiaceae is presented in Mongolia by 2 subfamilies, 8 tribes, 11 subtribes, 39 genera and 76 species. Species distribution is summarized in table 1.
